# A 15-minute guard tour field test

Review patrol records before deployment

A practical exercise from the PatrolTech team

# The test route

## Minutes 0–3

Choose two test checkpoints.
Assign an operator and a reviewer.

Write down the expected visit sequence and the phone you will use.

[Open the daily activity report template]

# Recording without connectivity

**Minutes 3–7**

Enable airplane mode on an authorised test phone.

Record a visit and a sample incident. Note what the app says about locally saved or pending records.

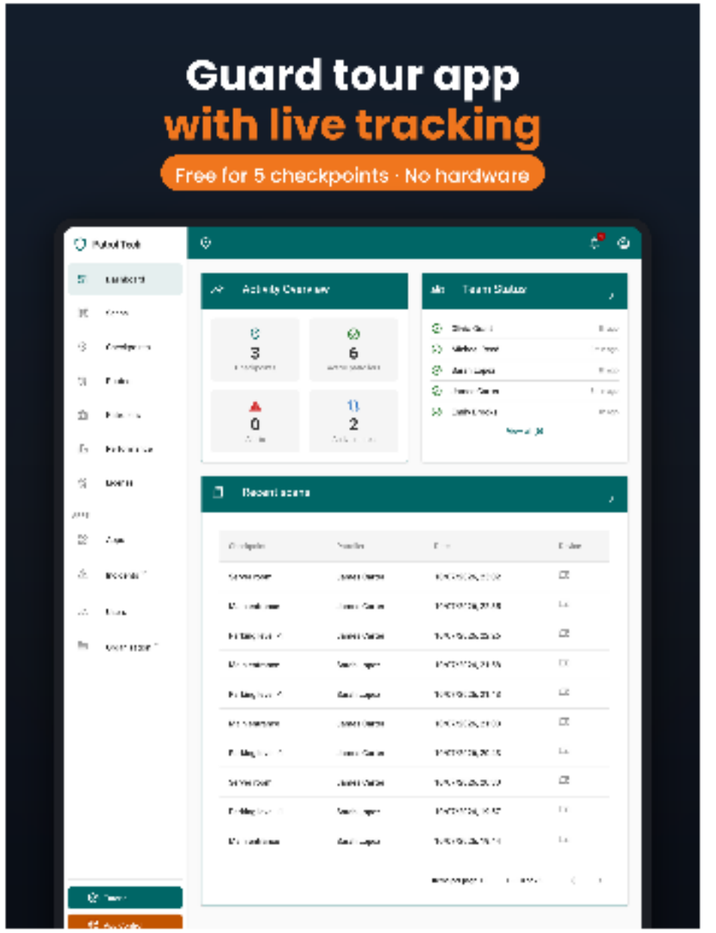

Keep this exercise separate from live safety procedures.

# Reconciliation after reconnecting

## Minutes 7–11

Compare the expected visits with the records received.

Distinguish visit time from arrival time. Record missing entries, duplicate behaviour and any work still pending.

Official demonstration image. It does not show results from this exercise.

# Evidence sheet for the reviewer

Mark each check as observed, not observable or needing follow-up.

| Check | Evidence to keep |
| --- | --- |
| Visit and arrival times | The two timestamps, with their definitions |
| Delivery | Expected visits compared with records received |
| Ordinary retry | Whether a retry produces a second record |
| Incident context | Checkpoint, note and attachment visible to the reviewer |
| Pending work | Any unsent record and the status shown to the operator |

**Turn important findings into RFP requirements**

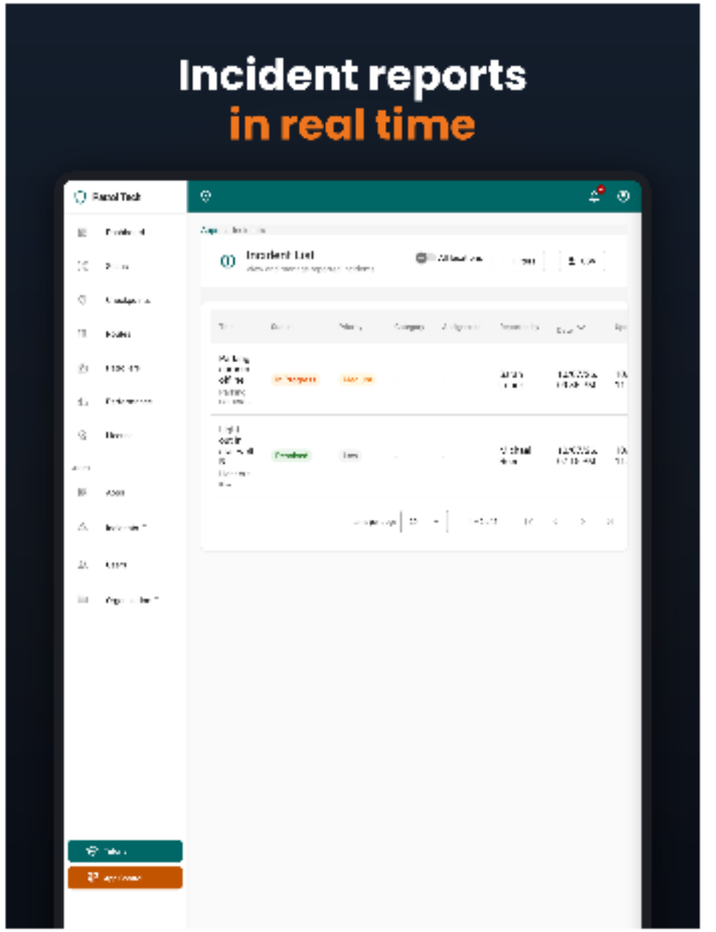

# Incident handover

**Minutes 11–15**

Ask a second person to reconstruct the event from the record.

Keep observations separate from actions. Identify who owns the next step and what still needs confirmation.

**Open the incident report template**
